01 / Prepare a safe manual test

Use a new disposable project named **Sunday Store Manual Test**. Keep your real client data untouched. This guide tests ScopeSathi's management workflow; it does not test a real store implementation.

Preparation	Action
Open application	Use http://127.0.0.1:5173/ while the local API is running. Sign in as the owner.
Second account	For quote tests, use a separate verified Google account. Invite it as Viewer, accept the invitation and confirm shared access. Two sessions on this Mac can reach the same backend.
Connection	Settings should show verified Firestore connectivity. Current analysis should be labelled manual. Do not assume AI is connected because Google sign-in works.
Create / intake	Create the test project. Populate the seven intake fields using the supplied client brief. Save and reload; expect the saved values.
Upload PDF	Open Approved scope and upload only the supplied initial client brief. Expect selectable text; headings/line wraps may become draft entries.
Review extraction	The tested upload produced 21 line-based draft entries. Keep seven meaningful baseline clauses corresponding to R1-R7. Consolidate wrapped entries and remove headings/metadata. Preserve source quotes copied exactly from extracted text.
Approve baseline	Approve once as owner/reviewer. Expect v1 and preserved original brief. Initial intake becomes locked. Read the assigned requirement IDs; do not assume R1 equals REQ-001.

Record: upload result, number of draft entries, actual checkout and exclusions IDs, baseline v1 and whether reload preserves data.

If a scanned PDF has no selectable text, expect OCR guidance; automatic OCR is not available. If there are over 30 line sections, consolidate the brief before extraction.

Result: PASS / FAIL / NOT TESTED. Notes: _____

02 / Test three changes in one request

First create a task **Build checkout** linked to the actual R1 requirement ID. Optionally create **Order-history work** linked to R3. Set the included allowance to **1** round for this short test.

Submit this message under Change requests, source 'Synthetic client message', title 'Launch review', in a new related round:

> Please allow guest checkout alongside email-and-password sign-in. Guest customers must receive an order-tracking link that expires after 24 hours. Please include a CSV export of the signed-in customer's own order history and remove CSV exports from the excluded work.

Finding	Manual expected proposal
Modification: checkout	Reference the actual R1 ID. Use its exact current wording and the exact guest-checkout/24-hour sentence from the message. Proposed wording: Customers may sign in with email/password or check out as guests. Guest customers receive an order-tracking link expiring after 24 hours.
Modification: exclusions	Reference R7. Quote 'remove CSV exports from the excluded work' exactly from the message. Proposed wording: Native mobile applications and inventory integrations are excluded.
Addition: CSV export	No existing requirement ID/current quote needed. Quote the CSV-export passage exactly. Proposed wording: Signed-in customers may export their own order history as CSV. Link Order-history work explicitly if appropriate.

Without Gemini, open **Edit proposal & resolve questions**, convert the manual clarification entry, add findings and clear questions only after reviewing the meaning. Save the proposal. Use only exact quotes present in the document/request.

Approve: note 'Client confirmed guest flow and CSV boundary update.' Expect all three findings applied in one new version, checkout task marked Needs Review, history recorded and **one** round used. Verify CSV is no longer simultaneously excluded.

Result: PASS / FAIL / NOT TESTED. Notes: _____

03 / Test priced extra work

In Settings, configure **1 included round, INR 500 additional round price**, and select the second account as designated client after it has accepted project access. One round is already used.

Submit this as a new round called 'Saved addresses':

> Add saved delivery addresses for signed-in customers.

Step	Expected result
Manual proposal	Use addition: Signed-in customers may save delivery addresses. Request quote must match the message. No unresolved question should remain.
Meter	Used 1, remaining 0. The new round shows estimated extra work of INR 500. Pending work does not count as an approved round.
Try approval first	Approval should remain unavailable or fail until a current client quote is accepted. A free-text agreement cannot bypass priced consent.
Propose quote	Reviewer uses the cost meter. Client sees exact scope, INR 500 and who proposed it.
Decline / repropose	Client declines in their own session. Owner refreshes; approval stays blocked. Reviewer reproposes and client accepts.
Approve scope	Owner refreshes and approves separately. Quote supplies the recorded agreement. Expect used 2, remaining 0, approved beyond 1.
Record invoice	Only owner may record an existing reference, e.g. DEMO-INV-001, after quoted work is approved. This is a test record, not a generated invoice or collected payment.

Rate preservation: change policy to INR 700 after acceptance. The accepted quote remains INR 500. Changed scope requires another acceptance at the preserved rate for that round.

Scope change check: before approval/invoicing, edit a proposed requirement after acceptance. Approval must be blocked until the reviewer proposes an updated quote and client accepts again. After invoicing, put further work in a new round.

Result: PASS / FAIL / NOT TESTED. Notes: _____

04 / Negative and boundary tests

Test input / action	Expected outcome
Ambiguous request: Make checkout easier.	Manual clarification remains unresolved; no automatic semantic match. Review questions block approval. Decide clarification; allowance unchanged. Clarified details become a follow-up request.
Correction: Fix order history so customers can see only their own orders, as originally agreed.	Reviewer confirms correction category, references current order-history requirement and resolves questions. Approval flags relevant tasks but consumes no additional round or priced quote.
No change: Please keep the existing keyword search and category filters.	Set no_change, reference the current search requirement and exact source. Approval records the decision without a new scope version/round.
Reject: Build native iOS and Android apps for the first release.	Reject with reason 'Outside launch agreement'. Baseline, tasks and used rounds remain unchanged.
Fabricated quote / task ID	Invented evidence or nonexistent references must be rejected; approved scope stays unchanged.
Stale review / concurrent edit	Open two sessions on the same revision; save in one, then save in the other. Expect stale-revision rejection. Do not blindly retry; refresh/reconcile.
Viewer / editor restriction	Viewer cannot edit/approve; editor cannot approve or configure pricing. Client viewer can accept only their own quote. Owner/reviewer cannot accept for them.
Wrong / revoked access	Pending invite grants no project access; wrong-account invite acceptance fails. Revoked member loses access and cannot accept a quote.

A correctly formatted but unintended email cannot be proved wrong by syntax validation. Test invalid syntax separately, and verify the intended recipient before sending an actual invite.

Avoid deleting your working projects during testing. If you remove the disposable project, use the explicit project-name confirmation.

Result: PASS / FAIL / NOT TESTED. Notes: _____

05 / Final user-facing checklist

Manual check	Expected observation
Home / sign-in / tour	Workflow and capabilities described honestly. Tour opens, next/back/skip/restart work. Optional remembrance follows privacy choice.
Distinct sections	With no project, each tab has a relevant empty state. Settings shows account and connections before project creation.
Profile / refresh / mobile	Profile and sign-out remain accessible. Loading transition appears on refresh; reduced-motion preference is respected. Narrow layout has usable navigation and forms.
Task board	Affected task shows Needs Review. A permitted member reviews work and updates status; reload persists it.
Version and history	Compare v1 with later versions. Reviewers, reasons, quote consent and policy/invoice changes appear in history.
Exports	Download scope/history JSON and tasks CSV. Open the files and confirm expected IDs and records. Quotes appear in project snapshots.
Welcome / invite mail	Use an authorized fresh account/recipient. Check styled welcome once, meaningful invite, link, matching-account acceptance and displayed delivery state. Current sender is configured; fresh delivery remains a manual test.
Cloud persistence	Reload/restart locally, sign in and confirm the same test project, versions, quote and invoice reference. Check Firestore records if you have console access.
Failure / unsaved input	In a controlled test, stop the backend during a save. Expect visible failure and preserved form input. Restart/retry. Do not disable rules or revoke production credentials.

Automatic analysis is pending. Text extraction/manual review can be tested now. To evaluate Gemini later, configure private backend key/model settings and compare actual output against the expected findings in this guide. Mark AI tests NOT TESTED until a genuine model request succeeds.

Record browser/device, account role, test date and screenshots of failures. No complete fresh browser/mobile or real inbox test is claimed by the accompanying report.

Outcome summary: Passed ____ Failed ____ Not tested ____
Issues / next actions: _____
