Online Store Requirements

Initial agreement - version 1.0. Synthetic client data for ScopeSathi testing. This document contains the initial scope only.

Project context

Goal: launch a small online store. Intended users: customers and store administrators. Deliverable: a responsive web application for desktop and mobile browsers. Constraint: use the payment provider selected by the client; do not build a new payment processor.

Required features

R1. Customers must sign in with an email address and password before checkout. Guest checkout is not included in the initial agreement.

R2. The store must provide a product catalogue with keyword search and category filters.

R3. Signed-in customers must be able to view their own order history. Customers must not see another customer's orders.

R4. Payments must be processed through the payment provider selected by the client.

R5. Store administrators must be able to update product availability and prices.

R6. The store must send an email confirmation after a successful order.

Acceptance criteria

A signed-in customer can find a product, complete checkout through the chosen provider and view the resulting order. An administrator can update a product price. A customer cannot access another customer's order history. Core pages remain usable on mobile browsers.

Excluded work and revisions

Native mobile apps, guest checkout, CSV exports and third-party inventory integrations are excluded from this initial baseline. One approved revision round is included. A round groups related changes reviewed together; new scope beyond this allowance needs a separate written agreement.
